

Hospital Billing & Patient Analytics - Project Report

About the Dataset:

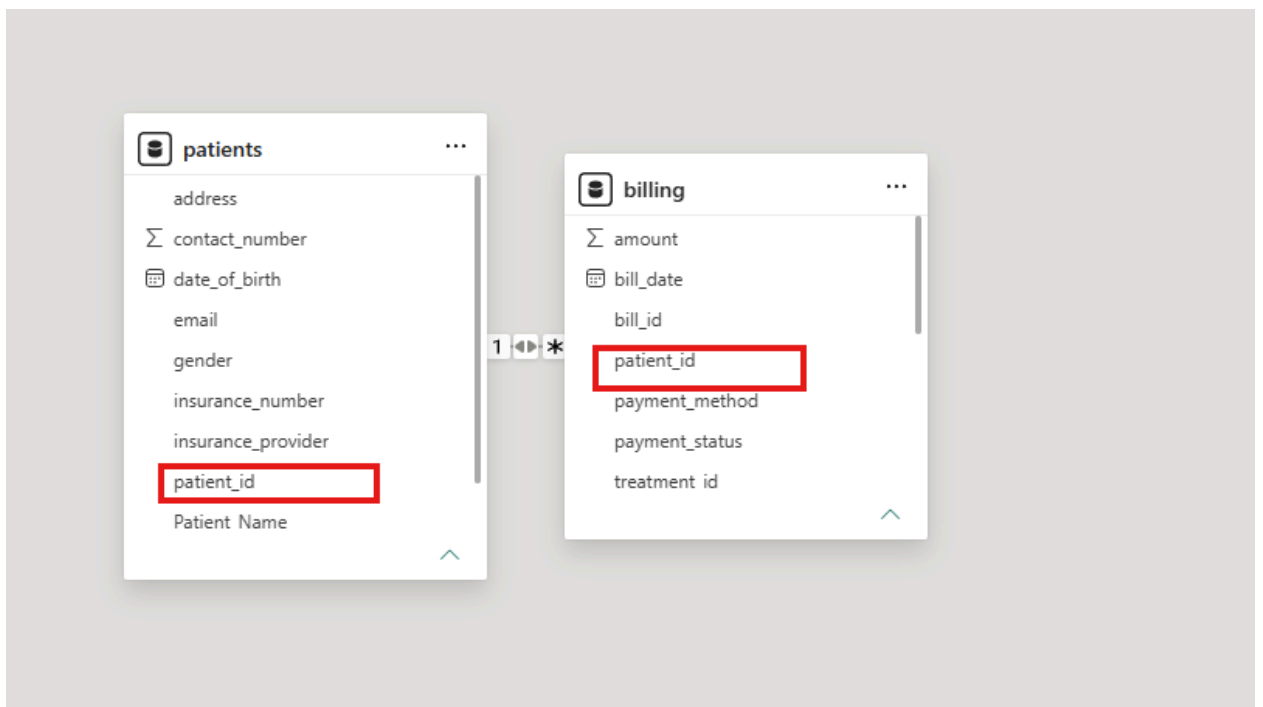

- Used two main tables: **Patients** and **Billing**.
- Contains patient info (age, gender, department) and bill info (amount, date, payment status).

Data Cleaning Steps:

- Opened Power Query Editor to remove null/blank values.
- Changed **bill_date** data type to Date.
- Removed unnecessary columns.

Data Model:

- Created a **1:N (One-to-Many)** relationship between **Patients** and **Billing** using **patient_id**.

DAX Measures Created:

- **Total Revenue** = SUM(billing[amount])
- **Total Bills** = COUNT(billing[bill_id])
- **Average Bill** = AVERAGE(billing[amount])

- YTD Revenue = TOTALYTD([Total Revenue], billing[bill_date])

Insights Discovered:

- Insurance providers and departments generating the highest revenue were identified.
- Breakdown of Paid vs. Pending payments was analyzed.
- Revenue trends across months were observed.
